

IDEATION PHASE

BRAINSTORM & IDEA PRIORITIZATION

Team ID	SWTID-2026-5117
Project Name	Auto Ticket Classification using Flow Designer
Team Size	4
Team Leader	Kasturi P
Team Member	Jenitta S,Malarmathi K, Madhu mitha P

Step 1: Team Gathering, Collaboration and Select the Problem Statement

The team discussed common challenges faced by the school IT helpdesk, especially the manual effort involved in reviewing and classifying incident requests. The team identified the need to automate ticket classification using ServiceNow Flow Designer by analyzing keywords in the incident's short description and description fields.

Problem Statement: The school IT helpdesk receives multiple incident requests daily from students and teachers, such as Wi-Fi issues, projector failures, password problems, and slow computers. Currently, IT staff manually reviews each request and assigns a category, which is time-consuming and inefficient. A Flow Designer-based automation can classify tickets automatically and route them to the appropriate category or support team.

Step 2: Brainstorm, Idea Listing and Grouping

- Automatically analyze keywords in the short description and description fields.
- Classify Wi-Fi and network-related incidents automatically.
- Classify projector and hardware-related incidents automatically.
- Classify password and account-related incidents automatically.
- Classify slow-computer and performance-related incidents automatically.
- Route classified tickets to the appropriate support team.
- Reduce manual effort and ticket-processing delays.

Step 3: Idea Prioritization

Priority	Idea	Priority Level
1	Automate keyword-based ticket classification	High
2	Classify Wi-Fi and network issues	High
3	Classify password and account issues	High
4	Classify projector and hardware issues	High

Priority	Idea	Priority Level
5	Classify slow-computer issues	Medium
6	Route tickets to the appropriate support team	High
7	Reduce manual processing effort	High

Project Focus: Use ServiceNow Flow Designer to automatically classify school IT incident tickets by analyzing keywords in the short description and description fields, and route the tickets to the appropriate support category or team.
